

Lab 4 - Chat History

Akshay V Gudur | PES1UG24CS047

Exported on 30 September 2026. This transcript contains the visible user/assistant messages available at export time for this lab request. Tool invocations and internal reasoning are excluded. Later messages, including the final file-delivery message, are not yet part of this export. For a complete end-of-session record, also add the real shared conversation link and export the finished chat using your browser.

https://github.com/SETAPESU26/47_target-aim-trainer

this is the topic i need to clone this locally and add to my acc and the submission should be made in <https://github.com/sickDoughnut-007/SE-submissions> with a new folder LAB 4, there should be min of 4 commit - 1 to debug and 3 to push new features and before pushing i need to screen record me pushing it and also the after results of pushing it

Assistant

I'll read the lab handout and check both repositories, then prepare the fixes, features, and commits. I'll leave the pushes ready for you to run while screen recording, so the recording captures the push and its results.

Assistant

The README specifies the four changes you need: fix shrinking-target hit detection, add a game-over screen, add replay with difficulty selection, and add sound feedback. The handout also requires 10-second before/after videos and a chat export.

Your submission repository identifies you as Akshay V Gudur, PES1UG24CS047; I'll use those details. I can prepare the code and four commits here, but you'll need to capture the recordings on your laptop before pushing.

Assistant

I reproduced the collision bug: when the target's visible radius is 15 pixels, a click 30 pixels from its centre still registers as a hit. I'll make drawing and hit detection use the same radius, then commit each of the three features separately.

I'm also preparing a ZIP with the original version, updated version, commit history, and Windows instructions. Nothing has been pushed.

Assistant

The collision fix and game-over screen are committed and passing their checks. Replay now resets the score, misses, timer, and target for each difficulty. Testing caught a layout issue with larger Easy targets overlapping the controls at the bottom; I'm correcting their spawn bounds before committing replay.

Assistant

All four requested changes are implemented, and 14 checks pass. Sound feedback covers hits, missed clicks, target timeouts, and the end of a round; M toggles mute.

I'll now check the screens and package the handoff. You'll need to record three things on your laptop: the original game, the updated game, and the terminal push followed by the GitHub results.

Assistant

The gameplay and game-over screens look correct, and all three difficulties completed simulated rounds. I'm using the PDF skill to export the chat and the Library skill to make the ZIP available.

The Windows guide will walk you through creating your personal fork, recording both versions, and pushing the four prepared commits. Adding the videos afterward can be a fifth commit, which still meets your minimum of four.
